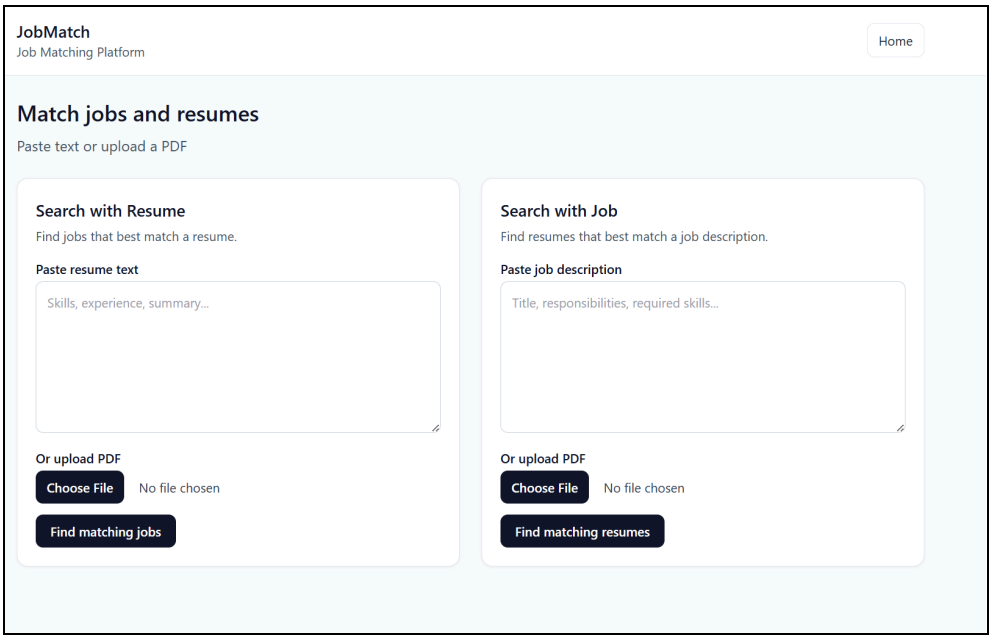
CSCE 470 Project Checkpoint - UI

Team Members: Brayden Bailey, Campbell Wright

For our user interface we wanted to focus on making it as intuitive as possible for the users. There are two options for users, they can either search based on their resume which will return matching jobs or they can search based on a job description which will return resumes that match.

We will give users two separate ways to run their search. They can either paste the text into a text box, or they can upload the job description or resume as a pdf. This should make it as easy as possible for our users. Shown below is how the page will look when users first open the applications.



After a user submits their search they will be taken to a results page where they can see the 10 most relevant results for their search. The first picture below shows when a user searches with their resume, they can see job postings listed by the title. If the user clicks on the open button or anywhere on the card they are taken right to the job listing page so they can see more details or apply. The second picture depicts the results page when you search using a job listing. You can see each of the candidates names and expand to see their full resume information. We also plan to give the ability to download a candidate's resume so it can be saved if needed.

Jobs matched to resume

Showing top 10 matches.

Software Engineer (Python) — Search & Retrieval Open
Job posting

Machine Learning Engineer — NLP Open
Job posting

Backend Engineer — Flask APIs Open
Job posting

Data Scientist — Recommender Systems Open
Job posting

Full-Stack Developer — React + Python Open
Job posting

DevOps Engineer — CI/CD Open
